## 1. Experimental Section

### 1.1. General Remarks

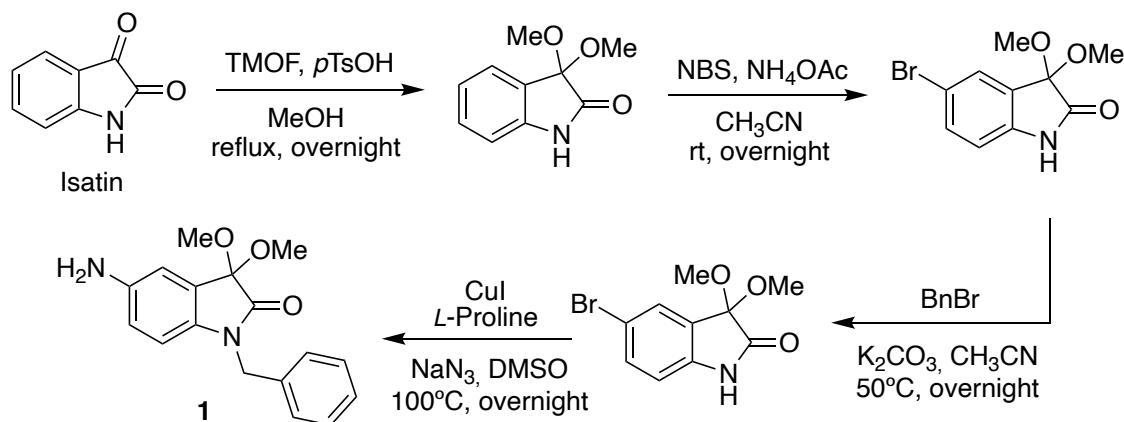

All reagents were obtained from Sigma–Aldrich, Acros, Alfa Aesar and TCI and were used as received. Solvents were used as received. Reactions were conducted in round-bottom flasks, or in a Radley's® 12-position carousel reactor, or in vials or beakers. Microwave reactions were conducted with a Biotage Initiator+ Microwave System with an automated position system. Column chromatography was carried out on silica gel (Carlo Erba, 40–63 µm, 60 Å). Thin-layer chromatography (TLC) was carried out on aluminium-backed Kieselgel 60 F254 plates (Merck and Macherey–Nagel). Plates were visualized either by UV light or with phosphomolybdic acid in ethanol. NMR spectra were recorded with a Bruker Avance III instrument (400 MHz). Chemical shifts ( $\delta$ ) are given in parts per million (ppm) with respect to the solvent ( $\text{CDCl}_3$ ,  $^1\text{H}$ :  $\delta$  = 7.26 ppm,  $^{13}\text{C}$ :  $\delta$  = 77.2 ppm). Coupling constants ( $J$ ) are reported in Hz and refer to apparent peak multiplicities. Splitting patterns are reported as s (singlet), d (doublet), dd (doublet of doublets), t (triplet), q (quadruplet), m (multiplet), br (broad). Mass spectra (MS) were recorded with a quadrupole mass spectrometer Waters ZQ4000 (Chemistry department, University of Salamanca). The ionization was performed by ESI and the samples were infused in methanol.

Benzyl azide **6** was synthesized using a previously literature reported microwave method.[ 1]

NBS: *N*-bromosuccinimide; TMOF: trimethyl orthoformate; *p*TsOH: *para*-toluenesulfonic acid; DMSO: dimethyl sulfoxide; TFA: trifluoroacetic acid.

### 1.2. 5-Amino-3-protected oxindole component

The synthesis and characterization of 5-amino-1-benzyl-3,3-dimethoxyindolin-2-one **1** was already reported in literature by our group[2-4]. A general scheme is given in Scheme S1.

**Scheme S1.** Synthetic path to access 5-amino-1-benzyl-3,3-dimethoxyindolin-2-one **1**.[2-4]

### 1.3. The Ugi4CR: General Procedure

In a glass vial with a magnetic stirrer was added the corresponding 5-amino-1-benzyl-3,3-dimethoxyindolin-2-one **1** (1 equivalent), the carboxylic acid **2a-o** (1.5 equivalents), the ketone/aldehyde **3a-d** (1.5 equivalents), the benzyl isocyanide **4** (1.5 equivalents), ZnF<sub>2</sub> (10 mol%) and MeOH (2-3 mL). The vial was closed with a plastic cap and the reaction mixture was left stirring for 2 hours at room temperature. The solvent was evaporated under reduced pressure and the crude reaction mixture purified in a short chromatographic glass column with SiO<sub>2</sub> flash using CH<sub>2</sub>Cl<sub>2</sub>:AcOEt (5:1), (1:1) as eluents.

## 2. Biological Assays

### 2.1. Cell lines and culture

The human solid tumor cell lines used in this study were the non-small cell lung cancer A549 and SW1573, the cervix cancer HeLa, the breast cancer cell lines HBL-100 and T-47D, and the colon cancer WiDr. Cell lines were obtained from Prof. Godefridus J. Peters (VUmc, Amsterdam, NL). The maintenance of cell cultures was in 60 mm Petri dishes in a humidified air incubator (37 °C, 5%  $\text{CO}_2$ , 95% humidity). The cell culture medium used was RPMI 1640 supplemented with 5% heat inactivated FCS, 2 mM L-glutamine, 100 U/mL penicillin and 0.1 mg/mL streptomycin. Cell cultures were passaged biweekly using 0.05% trypsin and maintained at low passage. Single cell suspensions were counted using Moxi Z automated cell counter.

## 2.2. Antiproliferative tests

On day 0, cells were inoculated in a volume of 100 µL per well at densities of 2500 (A549, HBL-100, HeLa and SW1573) or 5000 (T-47D and WiDr) cells per well, based on their doubling times. Stock solutions of isatins **8a–n** were prepared in DMSO at 40 mM. Each compound was tested in triplicate at different dilutions in the range 1–100 µM. Cisplatin served as positive control. Control cells received an equivalent concentration of DMSO (0.25% v/v, negative control). The drug treatment was started on day 1 after plating and incubation times was 48 h. Then, the SRB colorimetric method of the NCI was performed [5]. The optical density (OD) of each well was measured at 530 nm, using BioTek's PowerWave XS Absorbance Microplate Reader. Values were corrected for background OD from wells only containing medium. Antiproliferative activity of the compounds expressed as GI<sub>50</sub> was calculated according to NCI formulas [6].
